

Clinical Utility of Pharmacogenomic Findings: Beyond Single Variants

Hae Kyung Im, PhD

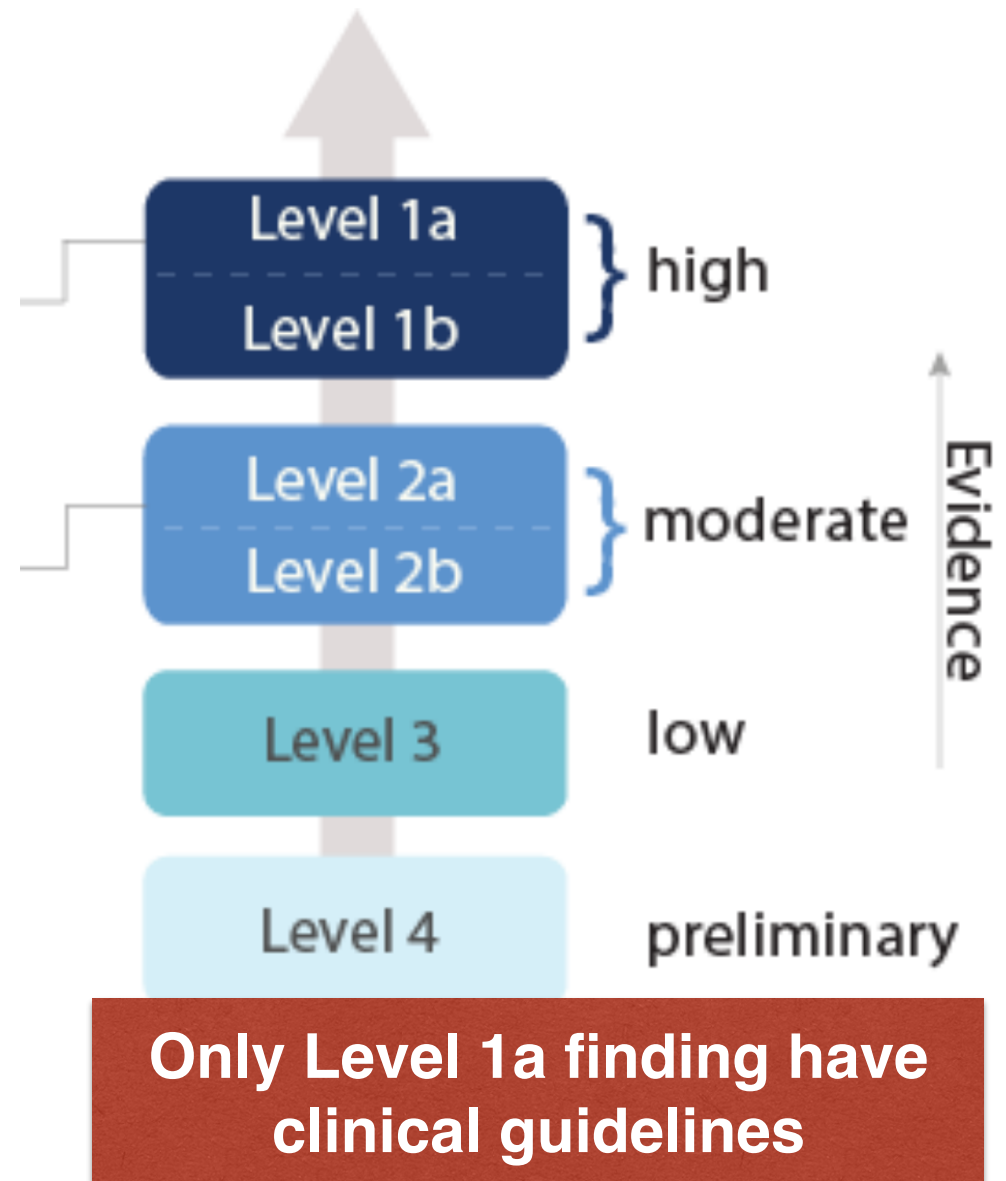

THE UNIVERSITY OF
CHICAGO

Successes and Challenges of Genome Studies

- GWAS/Sequencing
 - 10K robustly associated genetic variants
- New insights into biology of many traits
- Biological understanding is still lacking

Pharmacogenomic Findings

Evidence Level	Counts	%
1a	40	3
1b	17	1
2a	96	6
2b	74	5
3	1175	76
4	145	9
Total	1547	100

Genetic Architecture of Complex Traits

Genetic Architecture of Complex Traits

Single Variants Not Relevant for Highly Polygenic Traits

Challenges of Pharmacogenomic Studies

- Smaller sample size
- Even more important to integrate prior data
- Integrate other functional data
- Heritability estimates are harder
 - Limited family data
 - Usually samples greater than 1K are needed for GCTA

Bevacizumab Induced Hypertension

- Bevacizumab is a humanized monoclonal antibody that inhibits VEGF induced angiogenesis
- Hypertension is a common adverse event to bevacizumab treatment
- The incidence of hypertension with bevacizumab is 20-30%, while grade 3 or greater hypertension occurs in only 10-15% of patients.

Keston Aquino Michaels

Bevacizumab Trials

- CALGB 90401
 - a randomized double-blinded placebo controlled phase III trial comparing docetaxel and prednisone with and without bevacizumab in men with hormone refractory prostate cancer
 - n = 664 (with genotype data after QC)
 - PI: Howard McLeod
- CALGB 80303
 - a randomized phase III trial of gemcitabine plus bevacizumab versus gemcitabine plus placebo in patients with advanced pancreatic cancer
 - n = 152 (with genotype data after QC)
 - PI: Federico Innocenti

Bevacizumab Induced Hypertension

- Is primary hypertension risk score predictive of bevacizumab induced hypertension
 - Hypertension results from Cross Consortia Pleiotropy group (n~20K)
- Can we predict drug induced hypertension?
 - 90401 training set
 - 80303 test set
- Dissection of Hypertension

Hypertension and ICAM1

- Genetically predicted expression levels of ICAM1 was associated with
 - Primary hypertension WTCCC
 - Bevacizumab induced hypertension CALGB 90401
- Genetically predicted serum levels of ICAM1 was associated with
 - Bev induced hypertension CALGB 90401
- Increased levels of ICAM1 were associated with blood pressure in induced hypertension mice model

Summary

- Most single variant findings have limited clinical utility
- Whole genome approaches to prediction improves utility
- Bevacizumab induced hypertension example
 - primary hypertension results help in predicting drug induced hypertension
 - successfully predicted bevacizumab induced hypertension in independent study
 - combining primary + bevacizumab induced HT leads to improved prediction
- PrediXcan: novel gene based test that test mechanism yielded promising findings

Genes Associated with Rheumatoid Arthritis

PrediXcan: a Gene Discovery Approach

- PrediXcan is a powerful gene based association test
- It directly tests the molecular mechanism through which genetic variants affect phenotype
- Reduced multiple testing burden compared to single variant approach
- Unlike other gene based tests, it provides direction of effects
- Advantages relative to gene expression studies
 - Applicable to any GWAS datasets
gene expression levels are predicted from genotype data
 - No reverse causality
disease status does not affect germline DNA
 - Multiple Tissues can be evaluated
tissue expressions are only needed to build prediction models
